Bankout – Overview

What is Bankout?

Bankout is a payment request platform that allows users or systems to create payment requests for sending money from one account (sender) to another account (beneficiary). The initial release includes only one core functionality: Create Payment Request.

Core Capability

Create Payment Request: Capture transaction details along with sender and beneficiary information to initiate a payment request.

Fields captured:

- **Transaction ID:** Unique identifier for the payment transaction.
- **Ref ID:** Optional reference identifier for the request.
- **Amount:** Amount to be transferred.
- **Sender Name:** Name of the person or organization sending the money.
- **Sender Ac No:** Sender's bank account number.
- **Bene Name:** Name of the beneficiary.
- **Bene Account:** Beneficiary's bank account number.
- **Ac Type of Sender:** Type of sender account (Saving / Current).

Who Uses Bankout?

Bank operations teams, corporate banking users, payment processing systems, authorized administrators, and integrated banking systems use Bankout to create payment requests.

Benefits

Ensure accurate and validated payment requests Prevent invalid or duplicate transactions
Provide fast and secure request creation Maintain data integrity and audit trail
Support integration through secure APIs

Typical Workflow

1. Submit payment request with required fields.
2. System validates mandatory fields and formats.
3. System checks transaction uniqueness.
4. System validates sender and beneficiary details.
5. System creates the payment request.
6. System returns success response.
7. If validation fails, system returns error response.
8. All requests are logged for audit and tracking.

Summary

Bankout simplifies the creation of payment requests by capturing essential transaction, sender, and beneficiary details with strong validation and security. It provides a reliable foundation for future payment processing capabilities.
